

COS202 PRACTICAL ASSIGNMENT DOCUMENTATION

Student Information

Name: Fadahunsi Oluwaseyi Joshua

Matric Number: 241203007

Department: Data Science

Course Code: COS202

Documentation

This project consists of two Python applications: a Mathematical Calculator (MC) and a Personal CGPA Calculator.

The Mathematical Calculator is a simple graphical application developed using Python's tkinter library. It performs basic arithmetic operations such as addition (+), subtraction (-), multiplication (*), division (/), modulus (%), exponent (^), clear (C), and OFF (Exit). Users enter expressions through the interface, and the program evaluates and displays the result.

The Personal CGPA Calculator is a console-based Python application that calculates a student's GPA/CGPA using course scores and credit units. It applies if-elif-else selection control statements to determine the appropriate grade point for each score, computes the CGPA, and displays the corresponding degree classification.

Together, these applications demonstrate the use of Python programming concepts, including graphical user interface development, user input, arithmetic operations, loops, functions, and selection control statements. They provide practical solutions for performing mathematical calculations and monitoring academic performance efficiently.
